

Your Binoculars

Never look directly into the sun - with your naked eye, or with binoculars!

Binoculars are like two small telescopes placed side by side.

The center hinge allows you to adjust the distance between the barrels, to fit different size faces.

With the strap around your neck, bring the binoculars up to your eyes.

Fold the barrels in or out to best fit the distance between your eyes.

Next.....

To find a bird, it is best to start by looking for movement with your naked eyes so you have a full field of vision.

Once you see a bird that you want to look at more closely, don't take your eyes off it!

Raise the binoculars to your eyes while keeping your sight focused on the bird. This will make it much easier to find the bird through your binoculars.

With the bird in view, adjust the middle focus wheel by turning it left and right until the bird is clear.

Then fine-tune with the right eye adjustment wheel to make it even more clear. You only have to do this once.
